

Screenshot 1 — This is the testplay.yaml file that I created.

Screenshot 2— This is the second run of testplay.yaml. The first run already set everything up. Therefore, nothing needed to be updated during the second run.

Assignment

```
jimin-yang@test-host: $ nano ~/apache.yaml
jimin-yang@test-host: $ ansible-playbook ~/apache.yaml

PLAY [apache2 install for target1] *****

TASK [Gathering Facts] *****
[WARNING]: Host 'target1-mgmt' is using the discovered Python interpreter at '/usr/bin/python3.12', but future installation of another Python interpreter could cause a different interpreter to be discovered. See https://docs.ansible.com/ansible-core/2.19/reference_appendices/interpreter_discovery.html for more information.
ok: [target1-mgmt]

TASK [apache2] *****
ok: [target1-mgmt]

TASK [ufw] *****
changed: [target1-mgmt]

TASK [ufw firewall] *****
changed: [target1-mgmt]

TASK [ssh] *****
changed: [target1-mgmt]

TASK [http on port 80] *****
changed: [target1-mgmt]

PLAY RECAP *****
target1-mgmt : ok=6  changed=4  unreachable=0  failed=0  skipped=0  rescued=0  ignored=0

jimin-yang@test-host: $
```

Screenshot 3 - I created the apache.yaml .At first, I got a 'playbook not found' error due to the wrong filename apache install.yaml. Then I received a UFW module error because UFW was not installed on the target. After installing UFW, the playbook ran successfully and all settings were applied correctly.

Screenshot 4

```
jimin-yang@test-host: $ ansible-playbook ~/apache.yaml

PLAY [apache2 install for target1] *****

TASK [Gathering Facts] *****
[WARNING]: Host 'target1-mgmt' is using the discovered Python interpreter at '/usr/bin/python3.12', but future installation of another Python interpreter could cause a different interpreter to be discovered. See https://docs.ansible.com/ansible-core/2.19/reference_appendices/interpreter_discovery.html for more information.
ok: [target1-mgmt]

TASK [apache2] *****
ok: [target1-mgmt]

TASK [ufw] *****
ok: [target1-mgmt]

TASK [ufw firewall] *****
ok: [target1-mgmt]

TASK [ssh] *****
ok: [target1-mgmt]

TASK [http on port 80] *****
ok: [target1-mgmt]

PLAY [mysql install for target2] *****

TASK [Gathering Facts] *****
[WARNING]: Host 'target2-mgmt' is using the discovered Python interpreter at '/usr/bin/python3.12', but future installation of another Python interpreter could cause a different interpreter to be discovered. See https://docs.ansible.com/ansible-core/2.19/reference_appendices/interpreter_discovery.html for more information.
ok: [target2-mgmt]

TASK [mysql server] *****
ok: [target2-mgmt]

TASK [ufw install] *****
ok: [target2-mgmt]

TASK [ufw] *****
ok: [target2-mgmt]

TASK [ssh] *****
ok: [target2-mgmt]

TASK [mysql] *****
ok: [target2-mgmt]

PLAY RECAP *****
target1-mgmt : ok=6  changed=0  unreachable=0  failed=0  skipped=0  rescued=0  ignored=0
target2-mgmt : ok=6  changed=0  unreachable=0  failed=0  skipped=0  rescued=0  ignored=0

jimin-yang@test-host: $
```

Screenshot 5 - In the last part, I added mysql playbook on target2 in apache.yaml because Ansible allows multiple plays to be included in one playbook and executes them sequentially.

During the process, I initially encountered a YAML indentation error, which caused the playbook to fail. I resolved this issue by correcting the indentation so that each play could run independently.

I executed the playbook twice as required. On the first run, I can see some tasks were marked as "changed" because the configurations were being applied for the first time. On the second run, most tasks appeared as "ok," showing that the settings were already in place which means that it was not reapplied and changed by repeating executions.
